On either label, waiting divides the sensor noise at about the mean growth rate of the unstable modes, not the fastest
(a) Averaged label: camera, 8 angle frames
(b) Averaged label: angles and velocities, 1 frame
(c) Averaged label: energies, 1 frame
watch from τ = 0
watch from τ = 10
watch from τ = 20
watch from τ = 30
Mean distance on test (sites)
Sensor noise ÷ growth since release, σ_s·exp(−σ₁τ) (rad)
(d) Camera: each amplitude waits at about the mean rate of its growing modes
v1's label (Phase 3)
swing-averaged label
mean of the growing modes, ln 10 / σ̄
fastest mode, ln 10 / σ₁
Waiting per 10× noise (time units)
Swing amplitude A of the test runs (four bins; dots: fit, bars: 95% intervals, steps: predictions)
(e) Whole test pool, every setup (colors as in d)
σ₁
σ̄
S1
S2
S3
Waiting per 10× noise, whole test pool (time units)
